Team member : SELVI.L

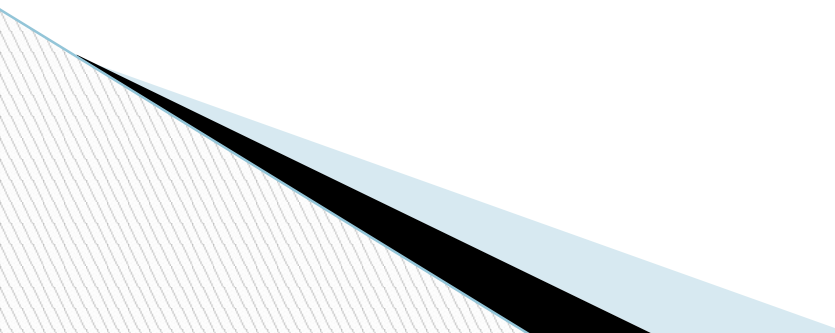

# **1.Introduction**

## **1.1 Overview**

**The definition of plane crash in the dictionary is an accident in which an aircraft hits lands or water and is damaged or destroyed. Pilot error is the number one cause of aviation accidents. Piloting an aircraft requires lengthy training, a knowledge of the mechanical components of an aircraft, and hand-eye coordination skills to effectively and safely maneuver an aircraft. Pilots also have to think ahead. However, crashes are most likely to occur in single engine planes and typically in general aviation rather than on commercial airlines. In fact, 79 percent of all aircraft accidents and 72 percent of fatal crashes involved single engine planes.**

**The thought of being involved in a plane crash isn't a pretty one. The fear so many people experience when flying is often linked to the worry that something might end up going wrong and you'll be totally and utterly helpless.**

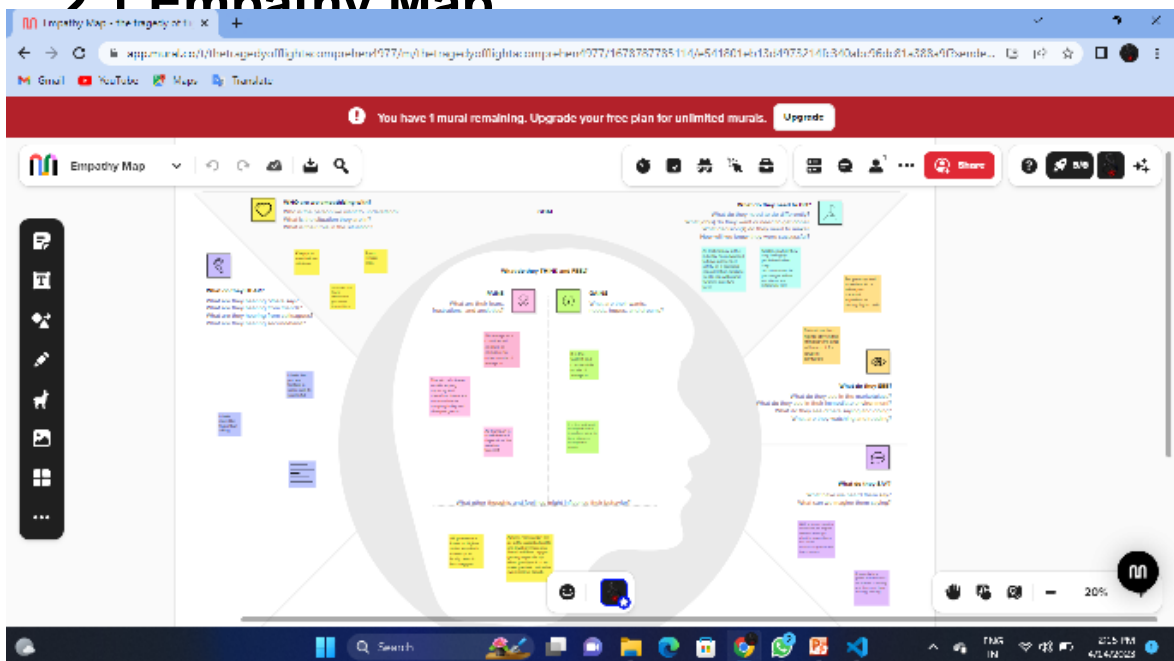

## 1.2 Purpose

Aviation accident analysis is performed to determine the cause of errors once an accident has happened. It is also used to analyze a database of past accidents in order to prevent an accident from happening.

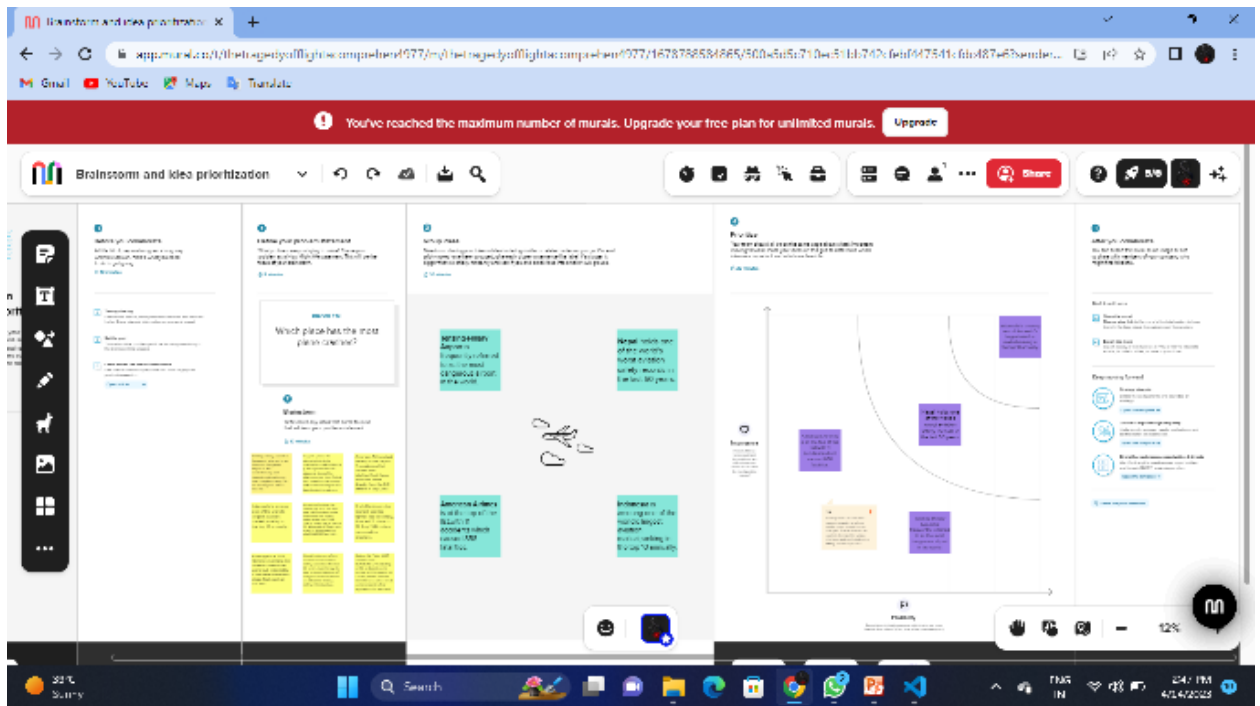

## 2. Problem Definition & Design Thinking

Which place has the most plane crashes?

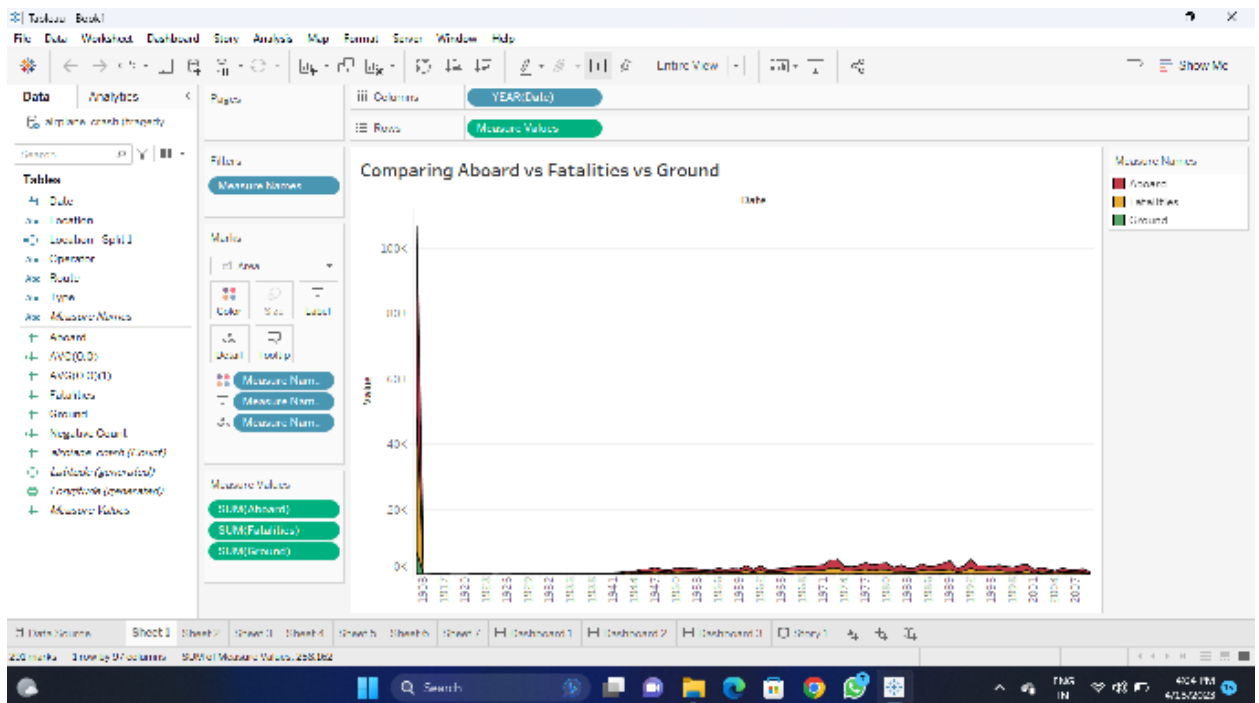

### 2.1 Empathy Map

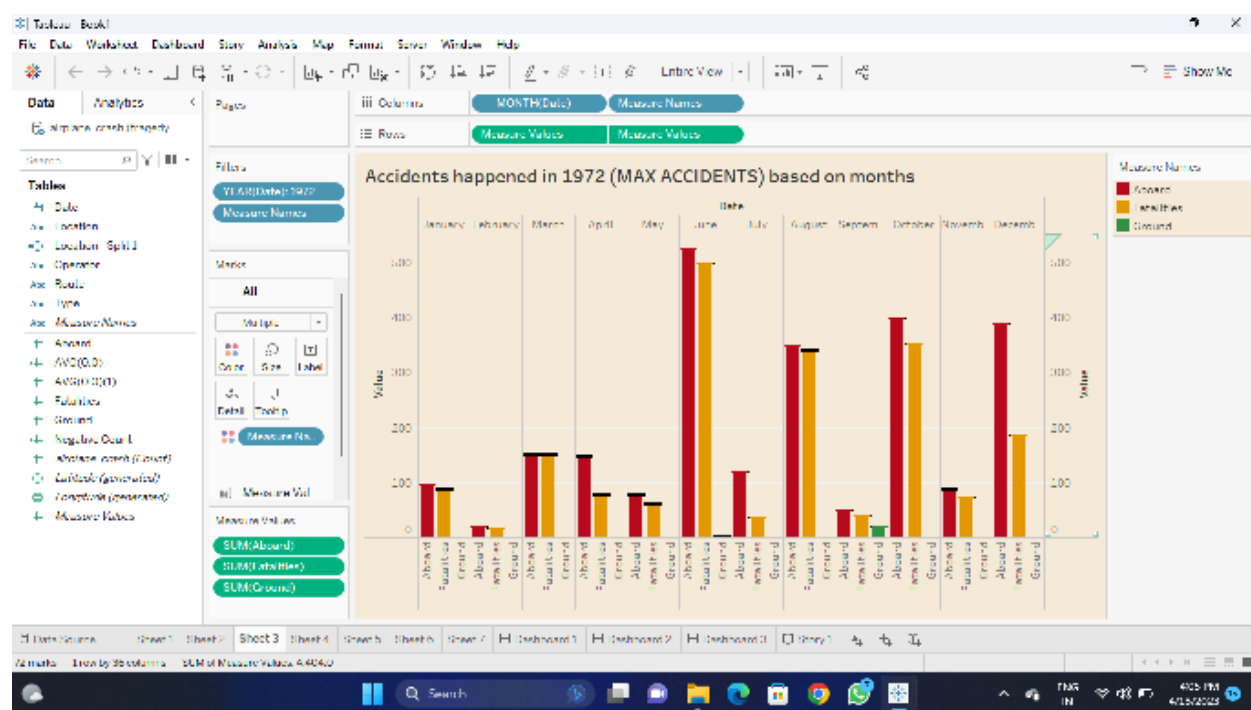

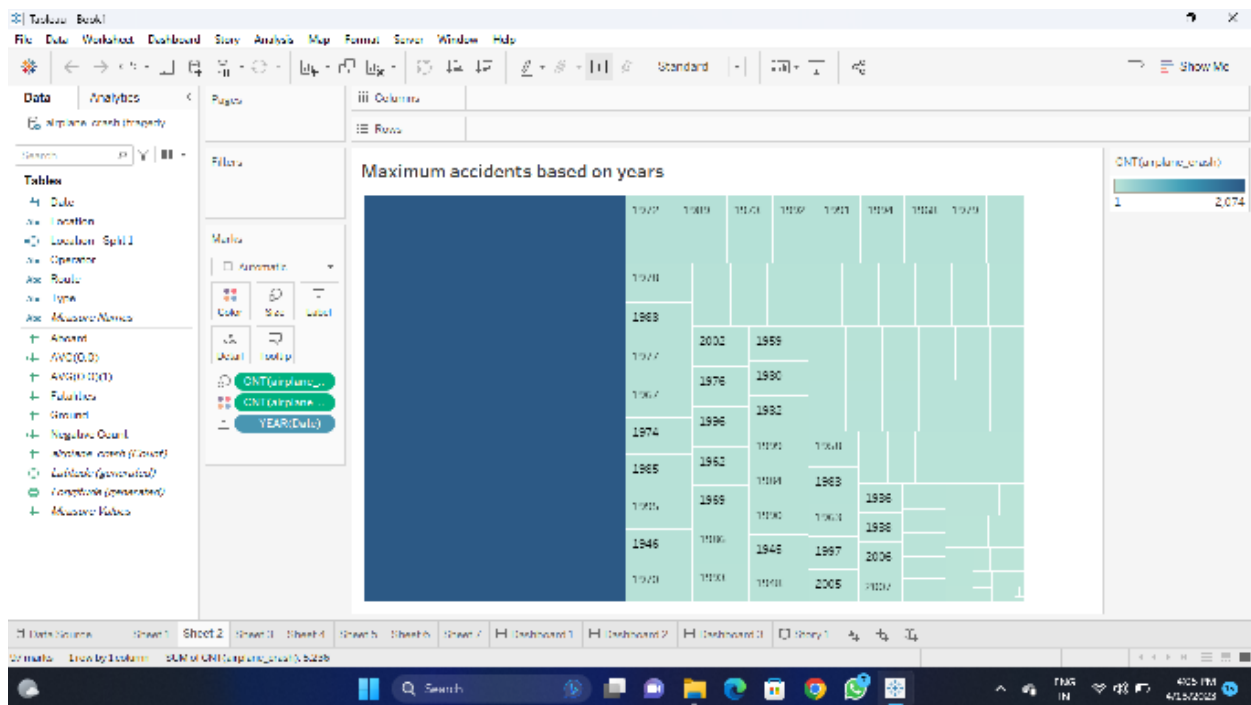

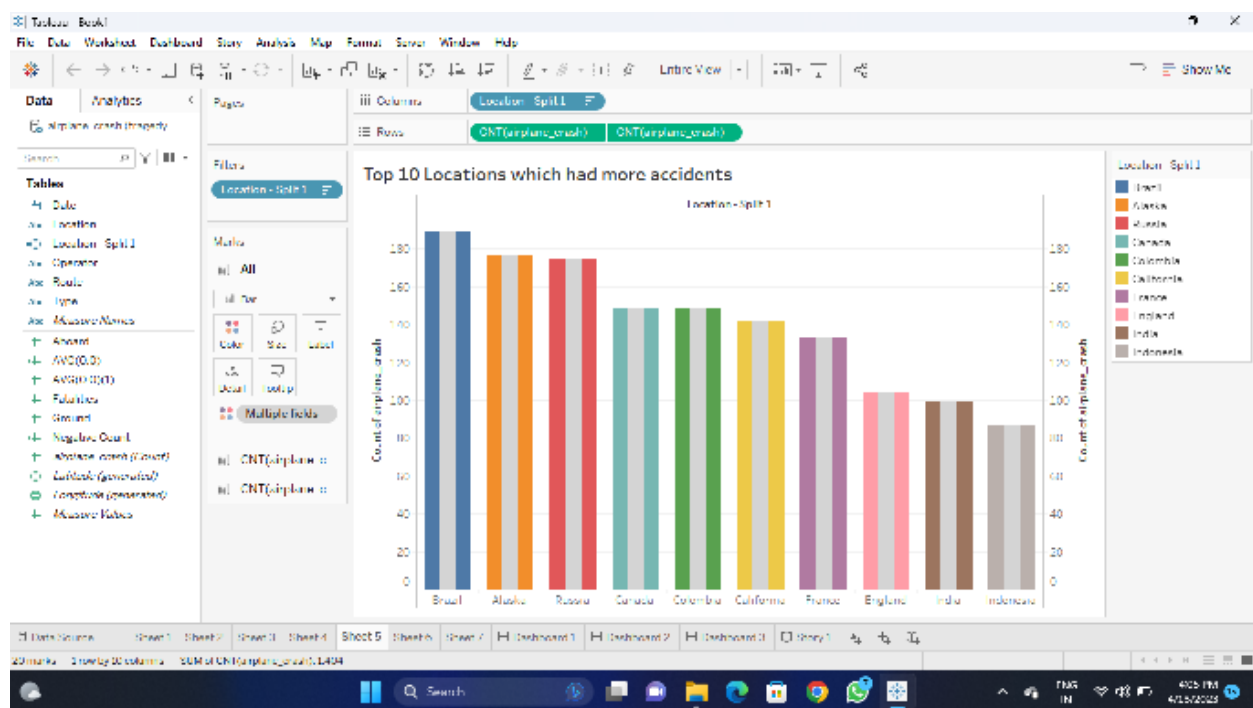

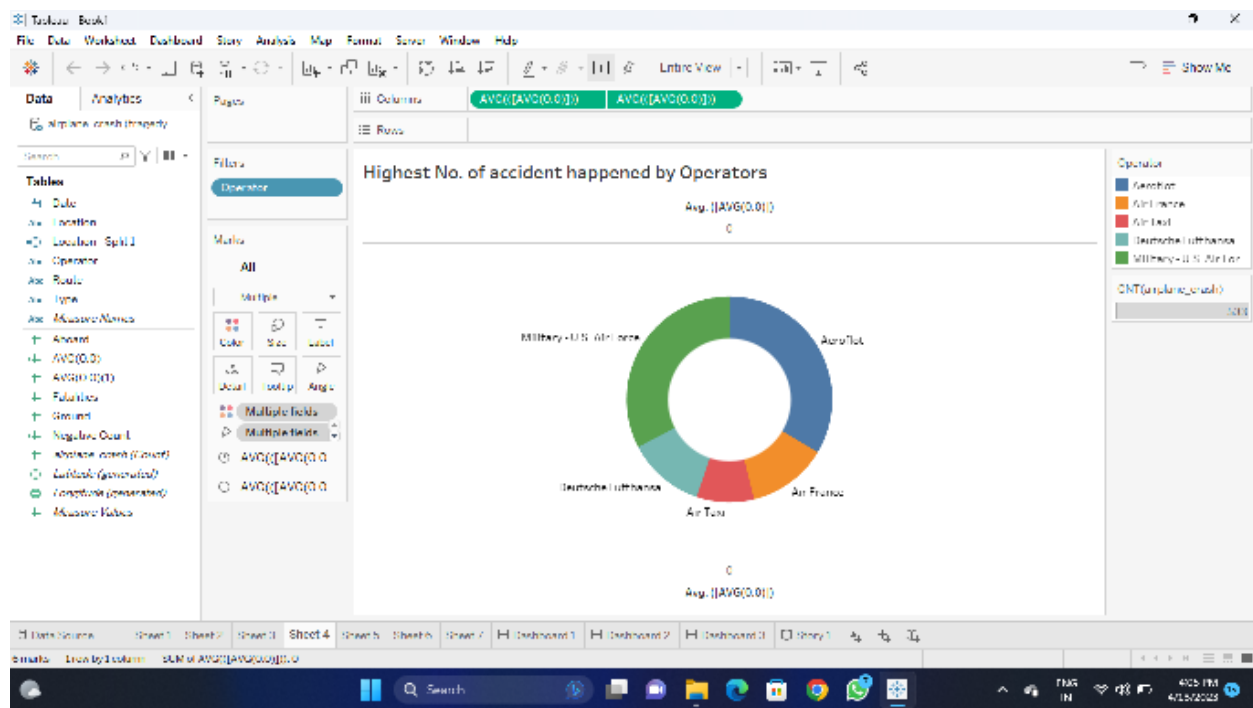

## 2.2 Brainstorm and idea prioritization

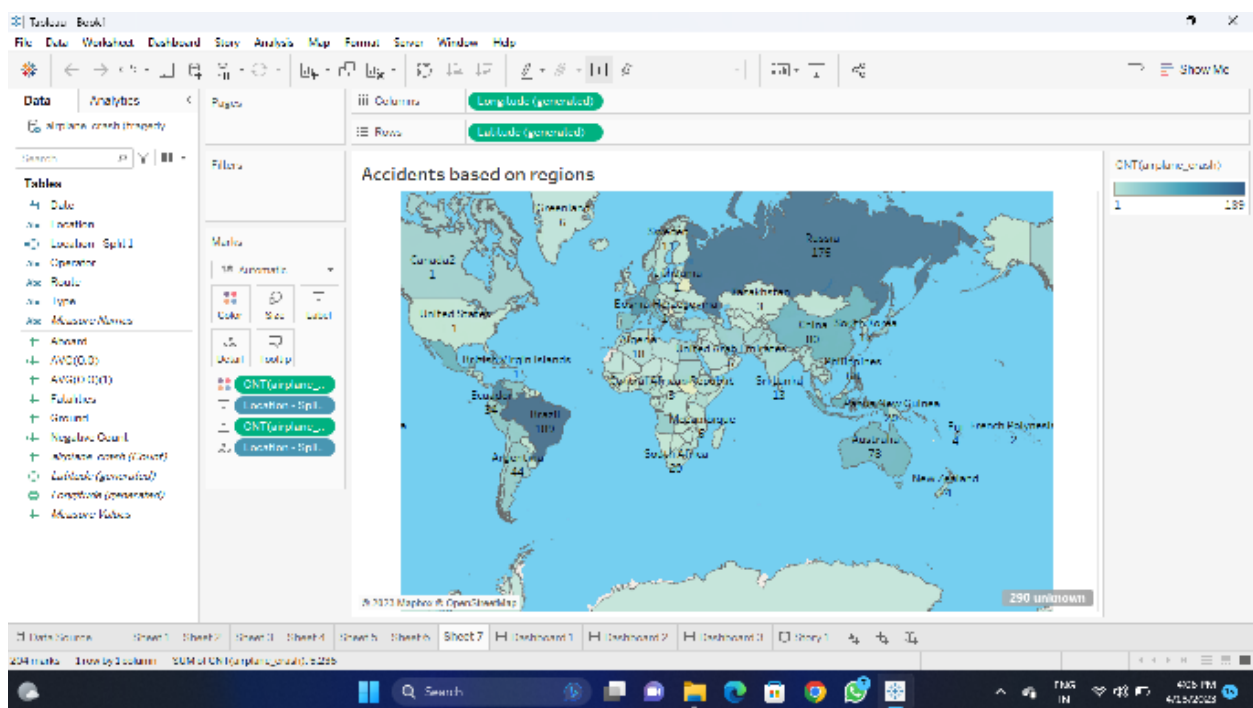

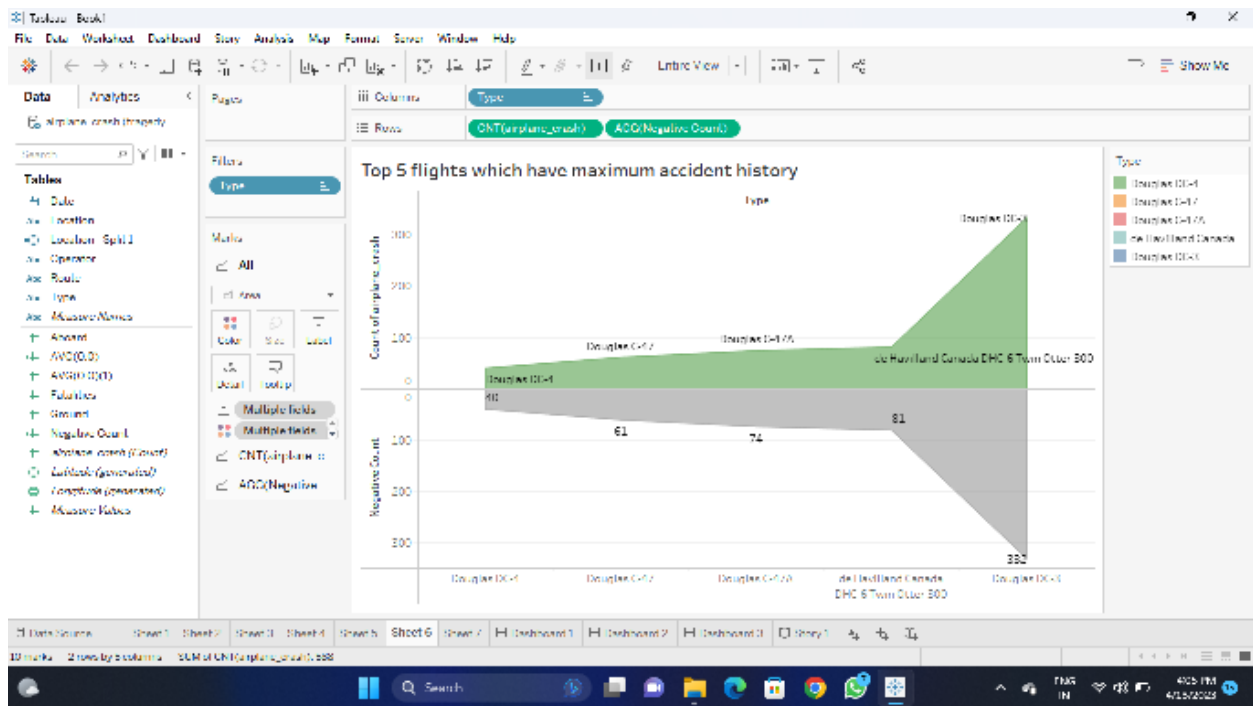

## 3. Report (Tableau Output)

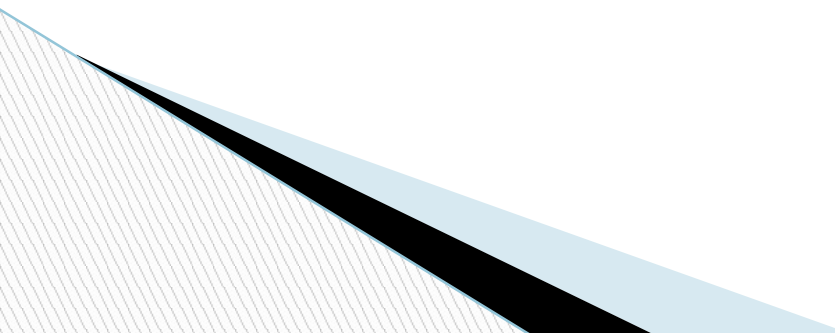

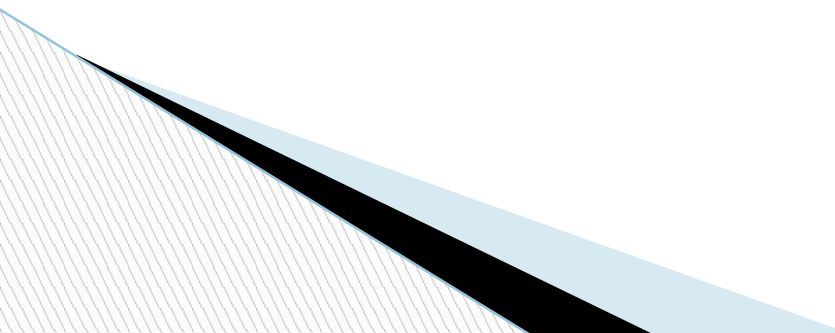

# 4. Advantages and Disadvantages

## 4.1 Advantages

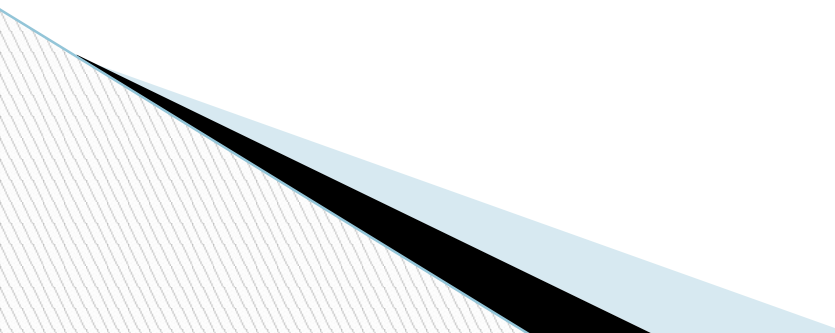

- **1. Accident reconstruction:** Crash analysis can help identify the cause of the crash and provide valuable information to help improve safety.
  - **2. Improved safety:** By analyzing crash data, manufacturers and other stakeholders can take preventive measures to reduce the risk of future crashes.
  - **3. Prevention of future crashes:** By analyzing crash data, manufacturers and other stakeholders can identify potential safety issues and take corrective actions to prevent future accidents.
  - **4. Improved design:** Manufacturers can use crash data to improve the design of their vehicles, which can reduce the risk of future crashes.
  - **5. Cost savings:** Accident investigations can save companies money by identifying the cause of the crash, potentially saving them from costly litigation.
- 

## 4.2 Disadvantages

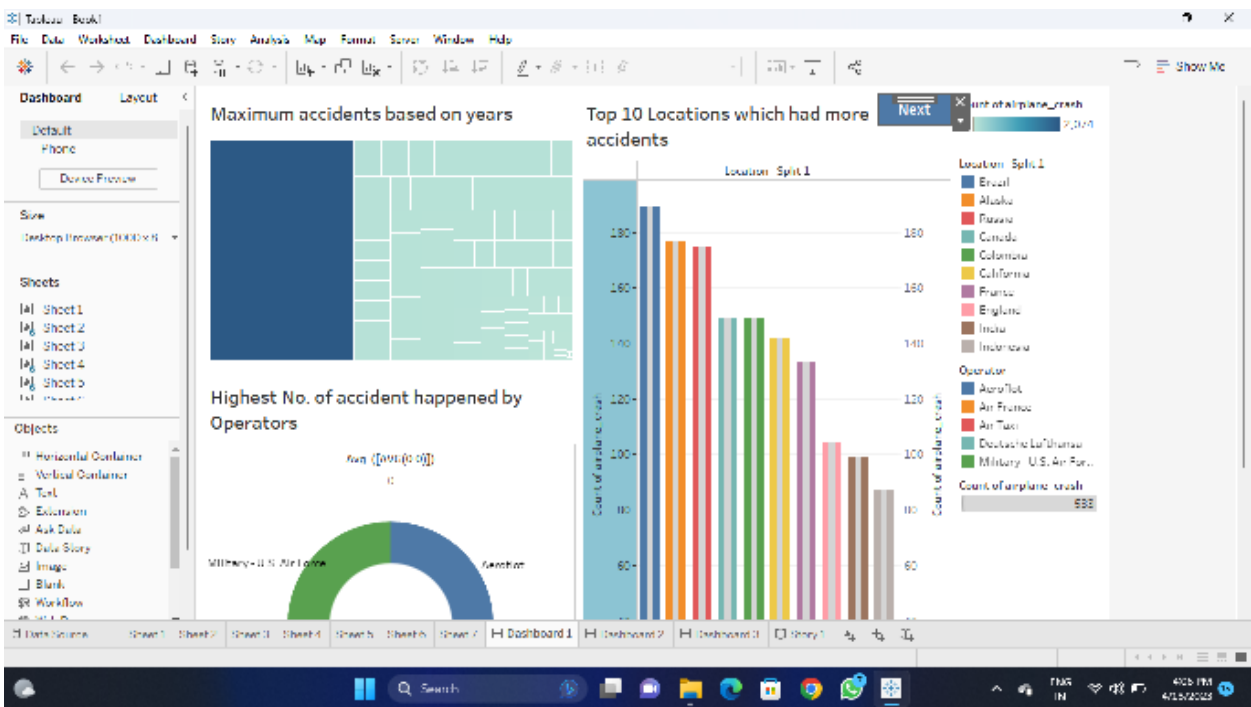

- 1. **Cost:** Crash analysis is an expensive process, requiring specialized equipment and highly trained personnel.
  - 2. **Time:** Crash analysis is a time-consuming process as it requires extensive data collection and analysis.
  - 3. **Difficulty of Interpretation:** Crash analysis is a very technical process, and the results can be difficult to interpret.
  - 4. **Incomplete Data:** Crash analysis can only provide insight into what happened and does not necessarily explain why the accident occurred.
  - 5. **Inaccurate Analysis:** If the data collected is incomplete or incorrect, the analysis may be inaccurate or misleading.
- 

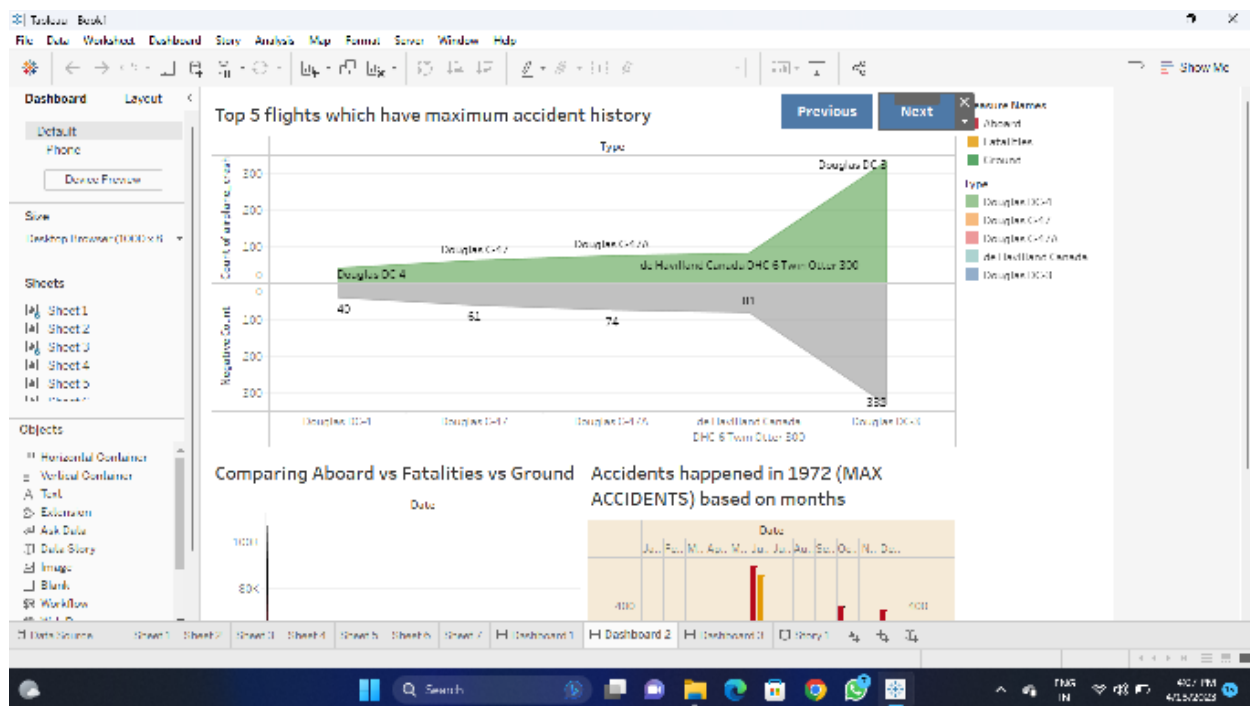

# 5.Applications

- 1. Air Crash Investigation Platform: This platform utilizes advanced analytics and data mining to investigate and analyze airplane crashes. The platform allows users to access detailed reports on past crashes, view various angles of the accident, and identify potential causes.
  - 2. Air Traffic Control Simulator: This simulator allows users to simulate air traffic control operations in order to practice accident prevention and analyze different scenarios that could potentially lead to a crash.
  - 3. Air Crash Event Reconstruction Software: This software helps to reconstruct the events leading up to an airplane crash to better understand the cause. The software allows users to access detailed data such as flight path, altitude, speed, and more.
  - 4. Aircraft Maintenance Software: This software allows users to track maintenance logs and ensure that aircraft are maintained according to safety standards. The software also helps to identify any potential issues that could lead to an accident.
  - 5. Airplane Flight Simulator: This simulator allows users to practice flying an airplane in order to gain experience and better understand the mechanics of flying an aircraft. This can help pilots to avoid potential accidents by understanding how to operate the aircraft safely.
- 

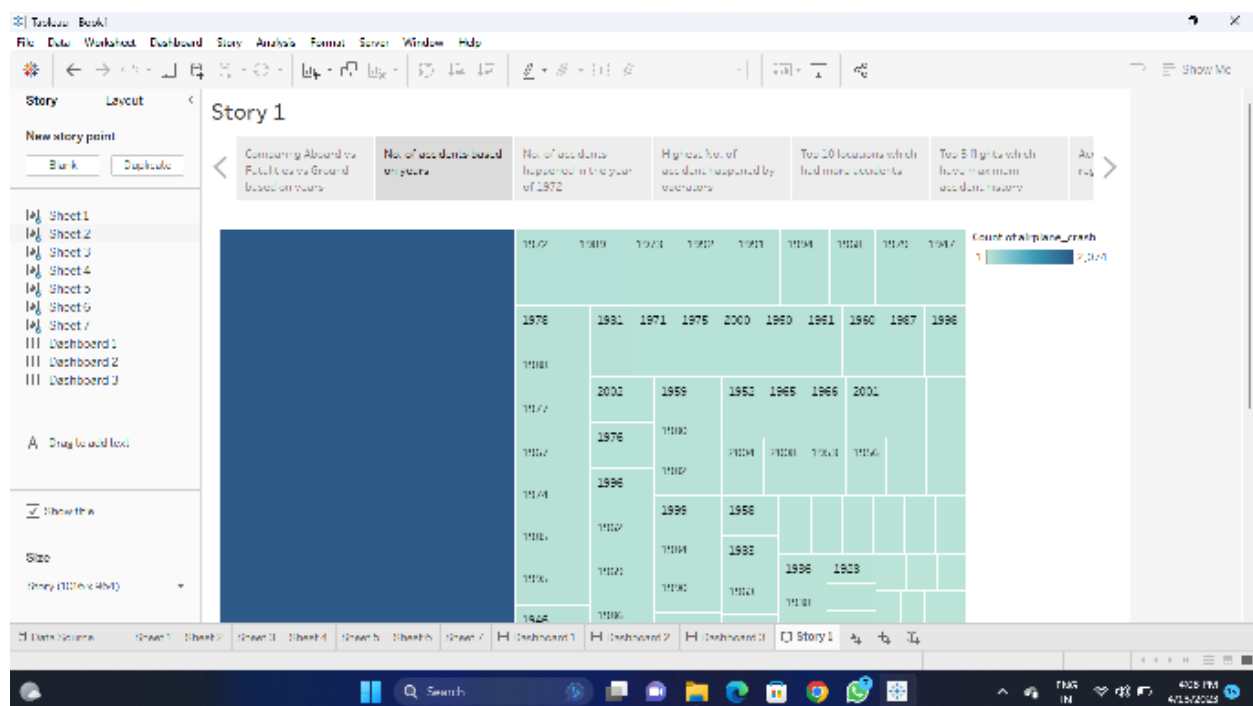

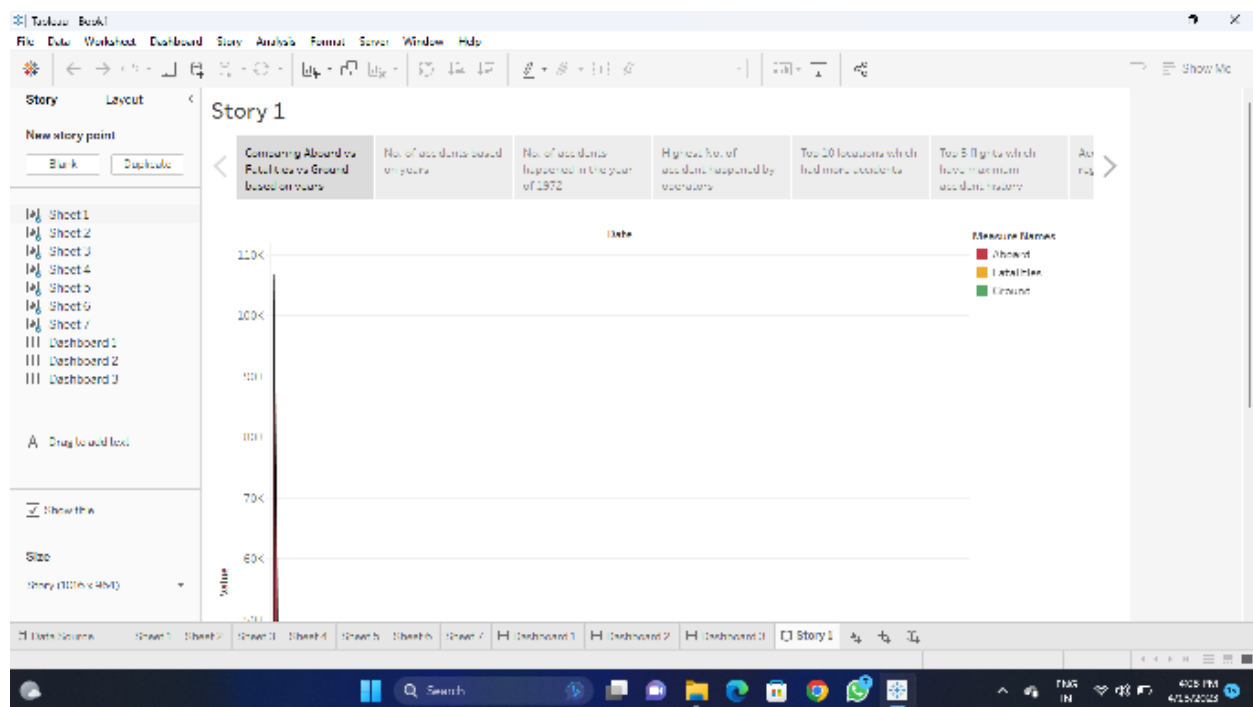

# 6.Conclusion

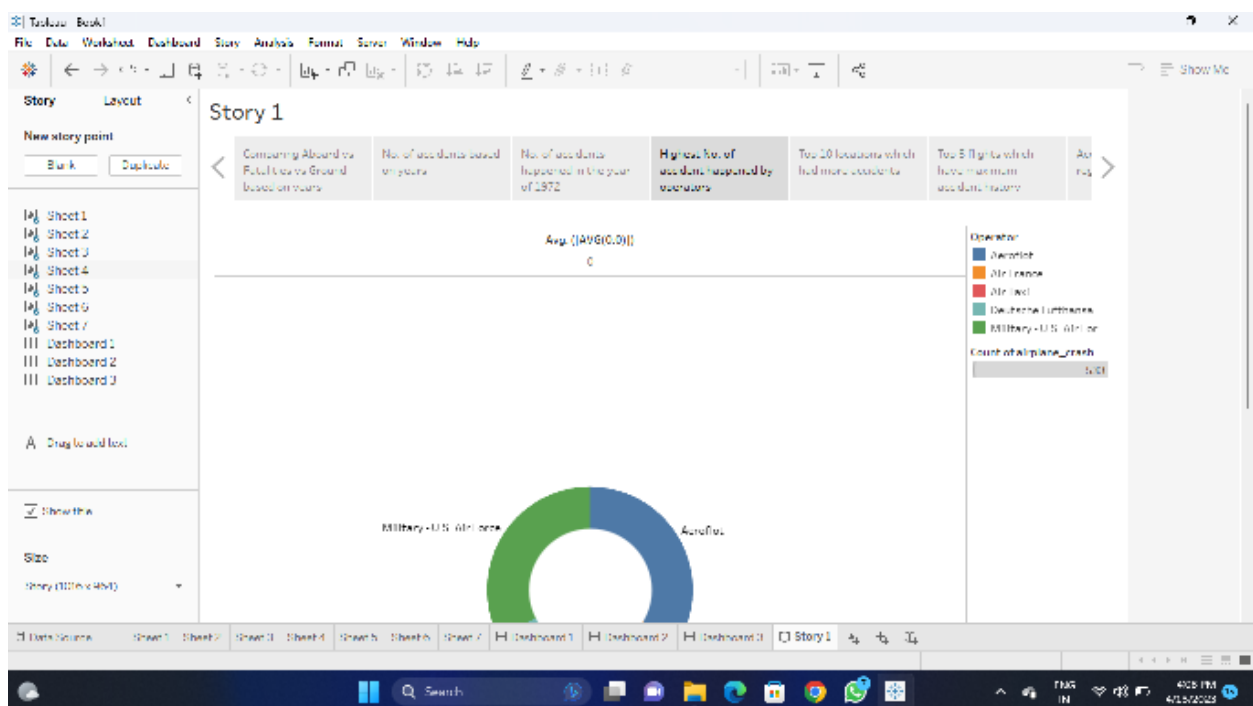

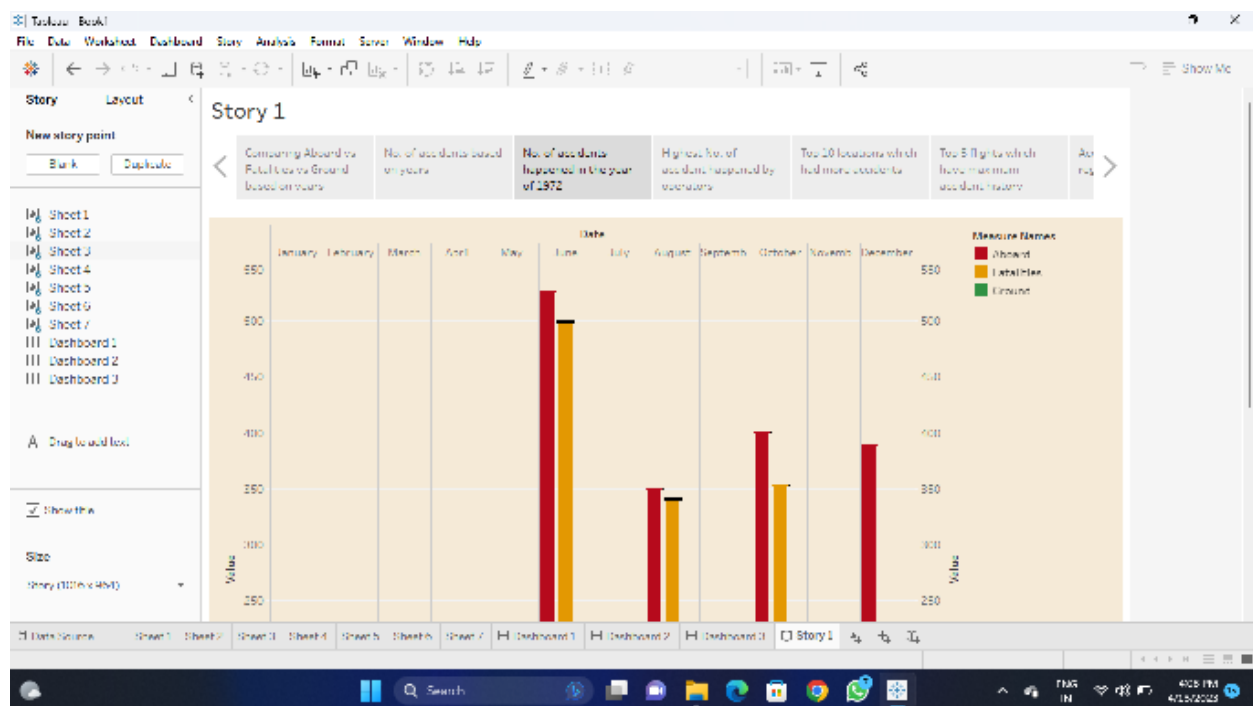

- Based on the data from the airplane crash analysis, it appears that pilot error is the most common cause of airplane crashes, accounting for nearly half of all incidents. Other causes of airplane crashes include mechanical failure, adverse weather conditions, and bird strikes. It is important for pilots to receive proper training and adhere to safety protocols in order to prevent accidents. Furthermore, airline companies must ensure that their aircraft are maintained properly and that all components are in good working order.
- 6.1 Dashboard

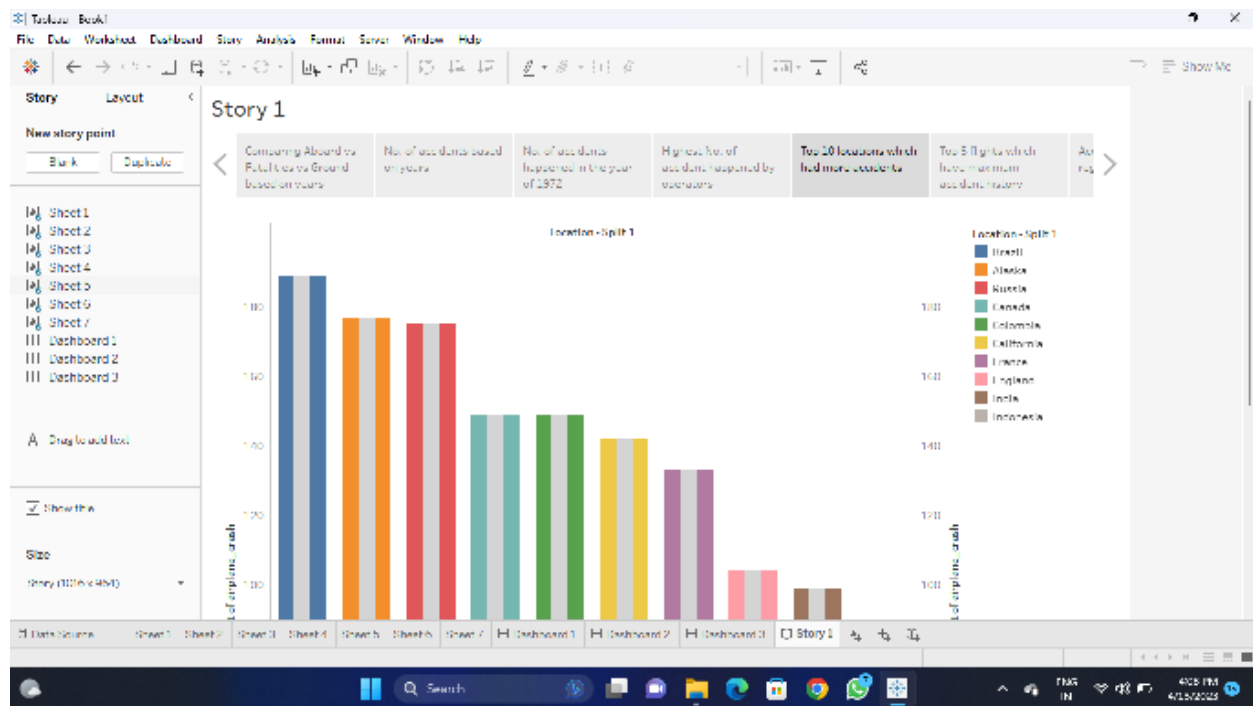

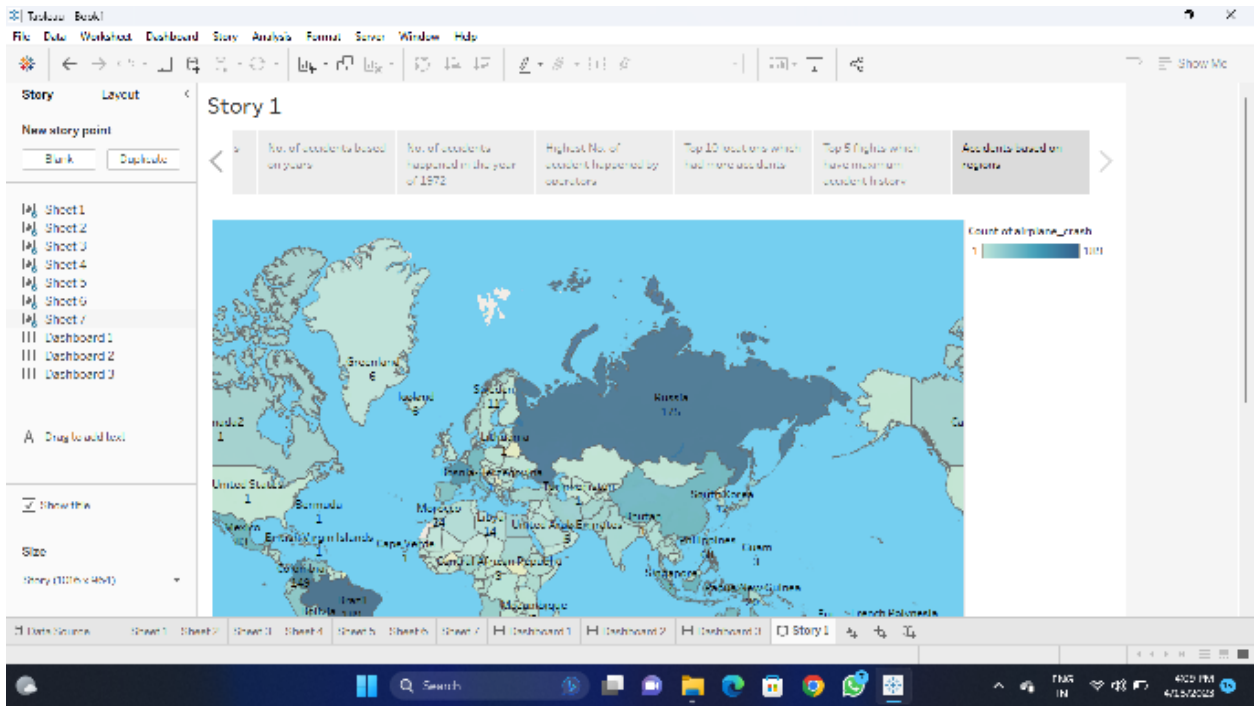

## 6.2 Story

## 7.Future Scope

In the future, the analysis of airplane crashes could be improved by collecting even more data from the aircraft during flight. This could include a variety of data such as the position of the aircraft, the speed, altitude, and other factors. This data could then be used to create predictive models that would better identify the potential causes of airplane crashes. Additionally, the use of advanced technologies such as artificial intelligence and machine learning could help to better analyze airplane crash data and provide better insights into the underlying causes. Finally, the use of data visualization techniques could help to make the analysis of airplane crashes more accessible to the general public.
